Blended Learning Proposal

Instructions: Take a moment to reflect on a course you have taught. What type of bottlenecks have students historically experienced in this course? What are the threshold concepts for this course? Could a blended learning design help you address these student challenges? How might that design look?

Student bottlenecks are "points in a course where the learning of a significant number of students is interrupted."	"Threshold concepts "represent a transformed way of understanding, or interpreting, or viewing something without which the learner cannot progress."	Blended learning moves course content out of the classroom to an online format for the purpose of enhancing learning.
